To: Subject: Fuller, Kathleen Hi Kathleen

I was wondering if you would be able to conduct a search for me.

Application SN 09/936508 (IFW application) having following claim 1:

- (As Amended) A costing composition for metal capable of being formed into a container, said enaling composition comprising:
  - a) a polyasser resin in the amount of 20-50% by set, said polyester resin comprising trimethylopropane in the amount of 0.1-102 by set, sexpensivelyloyal in the amount of 15-30% by set, at least one other polyel in the amount of 5-20% by set, a philatic acid in the amount of 20-60% by set, and subpic acid in the amount of 10-55% by set.
  - b) a resol resin in the amount of 1-15% by wt, and comprising a condensation product made from a phenal or homologue thereof and formaldahyde; and
  - a solvent component in the amount of 35-79% by wt. all ferrogoing weight percentages being based on the total weight of the coating composition; and

the coating composition being substantially free of blephenol-A-digheidyl ether, bisphenol-f-digheidyl ether, homologues thereof, and polyvinyl chiorate.

I am having trouble with the polyester polymer having rather detailed components: trimethylol propane, neopentyl glycol, other polyol, phthalic acid and adipic acid.

THe inventors are Christian Vogt and Peter Ambrosi, it is a 371 of PCT/EP00/01065 and priority to application 199 12 974.8 filed on 3/16/1999.

THe european search report is in the application, however references provided are overcome by the amendment to claim 1 (above).

V/R Kat.

- Topcoat integrity is a crucial property for coating systems for protecting AΒ metal substrates in conjunction with anti-corrosion primers. IR spectroscopy was used to examine the chem. changes seen during accelerated weathering in a model topcoat urethane polymer and to measure the coating ablation. During weathering the UV absorbance of the urethane coating showed a typical tail (yellowing) into the visible region that increased with exposure period. Effective UV dosage can be calcd. by integrating the spectrum of the incident radiation with the quantum yield for the degrdn. process and the UV absorption of the material under investigation. Depending on the form of the quantum yield, there is a clear acceleration of the absorption of damaging radiation because the absorbance increases with exposure. This non-linear relationship offers possibilities on how to est. a service lifetime; one could choose a value of the exposure period characteristic of the start of the acceleration in dosage, or one might choose the asymptote at which the dosage rate becomes very great. The UV tailing into the visible region is analyzed as an example of an "Urbach" tail which is usually attributed to structural disorder that introduces energy levels between the principle electronic

CC 42-3 (Coatings, Inks, and Related Products)

AΒ Two dual-cure processes consisting of a UV-initiated radical polymn. followed by either a UV-induced cationic polymn., or a thermal addn. reaction, were investigated. The feasibility of the processes was studied using an acrylate-oxetane monomer for the UV combination, and an acrylated oligoester for the UV/heat combination. It was shown by FTIR and Tg measurements, that both steps of each process could be performed efficiently and sep. This allowed the prodn. of a deformable partially cured coating, whose cure can then be completed, leading to the required final properties. Furthermore, it was demonstrated that the increase of the functionality of the reactive diluent led to a decrease of the thermal crosslinking extent. This is probably due to the reduced mobility of the reactive species that is caused by an enhanced UV crosslinking taking place during the first step.

AB Title org. solvent coatings contain epoxy resins modified by (un)satd. carboxylic acid (derivs.) or oxycarboxylic acids and P compds. contg. .gtoreq.2 OH groups. An org. solvent soln. contg. p-toluenesulfonic acid, and a polymer blend of Super-Beckamine L 125-60 40%, acrylic acid-Bu acrylate-Bu methacrylate-Me methacrylate-styrene copolymer 50%, and Epikote 1001 hydroxypivalate ester phosphite ester Et3N salt 10% showed good storage stability at 40.degree. over 1 mo and gloss, transparency, hardness, and corrosion/water/retort resistance.

The title compns., useful in electrodip coating, contain 3-70% binders, AB 5-16% phenolic resins and/or aminoplasts, 2-5% NH3 and/or amines, and 20-60% org. solvents. The binders comprise epoxy resins 20-80, polyester polycarboxylic acids (acid no. 30-150) 1-60, and unsatd. monomers (10-50% carboxylated) 10-50%, and have acid no. 20-150. A binder was prepd. by peroxide-initiated polymn. of acrylic acid 130, styrene 160, and Bu acrylate 40 g in the presence of 2400 g condensate (acid no. 20) of 1050 g bisphenol A epoxy resin (epoxy equiv. 3400) and 1000 g polyester (acid no. 85) from isophthalic acid 1330, adipic acid 145, neopentyl glycol 780, trimethylolpropane 268, and trimellitic anhydride 500 g, and heated with 190 g methylolated bisphenol A-HCHO resin. A 12% aq. dispersion (sp. cond. 2 mS/cm) of this compn. (80% neutralized with N,Ndimethylethanolamine) was electrodeposited on a tinplate can to give a coating with low porosity and good adhesion and resistance to sterilization.

PATENT NO. KIND DATE APPLICATION NO. DATE \_\_\_\_\_ \_\_\_\_\_ ----19780126 DE 1976-2633385 19760724 DE 2633385 A1. 19760724 PRAI DE 1976-2633385

Powder coating compns. that can be crosslinked at 150-200.degree. and which liberated a nonpolluting byproduct into the environment during crosslinking contain .gtoreq.1 hydroxyl group-contg. resin (OH no. 30-200, glass temp. 35-95, av. mol. wt. 1,000-10,000) and .gtoreq.1di- or polyacyl isocyanate, capped with an aliph. monoalkanol, optionally contg. .gtoreq.1 ether groups. Thus, 1:10:19:30:40 acrylic acid-Bu acrylate-hydroxypropyl acrylate-Me methacrylate-styrene copolymer [52522-02-8] (K value 23, 3% soln. in Me2CO) 228.7, [BuO2CNHCO(CH2)2]2 [66065-44-9] 56.3, bisphenol A epoxy resin (epoxide equiv. 450-500, OH no. 180) 15, poly(Bu acrylate) 3, finely divided silicic acid 2, and TiO2 195 parts were mixed in a continuous kneader at 100.degree.. The resulting melt was cooled, milled to a powder of particle size 90 .mu.m, electrostatically sprayed on degreased steel sheet, and hardened 30 min at 160.degree. to give a 100 .mu.m coating with pencil hardness 154, Erichsen value 0.3, and bending test value 2-3.

                               20011130
     A clear lacquer coat was obtained by: (I) application of a non-pigmented
      intermediate lacquer to a substrate for coating; (II) crosslinking the
     intermediate lacquer to form an intermediate lacquer coat; (III)
      application of an non-pigmented finishing lacquer to the intermediate
     lacquer coat and (IV) crosslinking the finishing lacquer, whereby the

AB The compns. having good water resistance and storage stability comprise a carboxy-contg. water-based polymer (A) and a hydrophilically modified polycarbodiimide (B) which has alternating units of carbodiimides and

alternating units of polyols linking to the previous units by urethane bondings and is terminated with hydrophilic units on 2 ends by urethane bondings. Thus, heating 700 parts 4,4-dicyclohexylmethane diisocyanate in the presence of 14 parts 3-methyl-1-phenyl-2-phospholene-1-oxide at 180.degree. for 16 h, mixing 226.8 parts the resulting polycarbodiimide with 200 parts polypropylene glycol of Mn 2000 and heating at 90.degree. for 3 h in the presence of 0.16 parts dibutyltin dilaurate gave an isocyanate-terminated copolymer which was modified with polyoxyethylene mono(2-ethylhexyl) ether to give a B-type copolymer. Mixing 80 parts a copolymer of Et acrylate 250, 2-hydroxyethyl methacrylate 150, 2-hydroxyethyl acrylate 223, methacrylic acid 77 and styrene 300 parts with 20 parts B and 10 parts pigment paste gave a compn. which could be thinned with water.

polyalkylene glycol ether hydrophilic modifier polycarbodiimide coating; water thinned hydrophilic modified polycarbodiimide multiblock copolymer coating; thermosetting hydrophilic modified polycarbodiimide multiblock copolymer coating; dicyclohexylmethane diisocyanate polycarbodiimide polyoxyethylene multiblock copolymer coating; polypropylene glycol carbodiimides multiblock copolymer coating; carboxy contg polymer polycarbodiimide alternating copolymer coating; acrylate polymer polycarbodiimide alternating copolymer coating; multilayered coating polycarbodiimide alternating copolymer

                            19981030
    Mixts. of vinyl monomers and crosslinking monomers are copolymd. in org.
     solvents in which the monomers dissolve but product polymers do not
     dissolve in the presence of polyester-based dispersion stabilizers which
     dissolve in the solvents to give crosslinked particle dispersions. The
     coating compns. comprise org. solvent-sol. OH-contg. polyesters, the
     dispersions, and org. solvent-sol. amino resins. Two-coat-1-bake or
     3-coat-1-bake process using the compns. as base coats, useful for
     metallic coating of automobile bodies, is claimed. Thus,
     isophthalic acid 250, adipic acid 220, hexahydrophthalic anhydride 110,
     neopentyl glycol 280, trimethylolpropane 160, and Cardura E 100 parts were
     polymd., dild. with LAWS and BuOH, and esterified with 3 parts glycidyl
     methacrylate to give a 65.8% dispersion stabilizer, 385 parts of which,
    xylene, heptane, an BuOH were added to a reactor in which Me methacrylate 100, Et acrylate 117, Bu acrylate 20, 2-hydroxyethyl acrylate 40,
     acrylonitrile 35, ethylene glycol dimethacrylate 18, and acrylic acid 10
     parts were polymd. to give a 50.1% nonag. resin dispersion.

PRAI JP 1996-354881
    A water-based thermosetting coating compn. comprises a polyester
    resin having pendant carboxyl groups and a crosslinking agent, both
    dispersed in an aq. medium contg. a neutralizing base. The polyester
    resin is formed from 1-40% polyalkadienediol or a hydrogenated product
    thereof and 2-50% 2,2-bis(hydroxymethyl)alkanoic acid. Thus, an aq.
    compn. contg. the polyester (no.-av. mol. wt. 2770; OH no. 150,
    acid no. 50) from coconut oil, trimethylolpropane, 1,4-
    cyclohexanedicarboxylic acid, adipic acid, dimethylolbutanoic acid, Epol,
    and caprolactone, hexamethoxymelamine crosslinker, pigment, and
    p-toluenesulfonic acid gave a coating compn. having good water
    resistance (40.degree. for 10 days), crosshatch tape adhesion 100/100,
    good chip resistance, and pinhole free limit 60 .mu.m.
    waterborne thermosetting polyester coating; dimethylolbutanoic acid
    polyester coating; melamine curable polyester coating; Epol polyester
    coating water dispersed; cyclohexanedicarboxylic acid polyester coating;
     caprolactone polyester coating water dispersed; chip water resistance

The prepn. and functionality and mol.-wt. evaluation of polyester polyols ΑB from diacids were studied. The polyesters were formulated into clear coatings and cured with a polyfunctional isocyanate. Dynamic mech. and thermal anal. was used to characterize the network structure. The crosslink d. (XLD), calcd. from the measured rubber modulus, compares favorably to the value predicted by Miller-Macosko theory. Tg is modeled in terms of compn. and crosslink d. to .+-.5.degree.. Hardness, as reflected by the room temp. modulus, is a functions of both Tg and XLD. The combination of hardness and flexibility can be optimized by combining low XLD with a high Tg-contributing monomer.

The solvents for the inks comprise dialkyldiarylalkanes I, II, and/or III (R1-R2 = C4 alkyl). Thus, a solvent comprised di-sec-butyldiphenylmethane 53, di-sec-butyldiphenylethane(1,1) 27, and di-sec-butyldiphenylethane(1,2) 20%. A liq. alkyd resin with acid value 9.0 was obtained by transesterification of soybean fatty acid 200, trimethylolpropane 100, neopentyl glycol 160, adipic acid 130, and isophthalic acid 175 parts. An ink contg. the resin and the solvent was printed on Al can by dry offset process, top-coated with a water-based acrylic amino-type varnish, and baked at 200.degree. to give a product without misting.

Decorative covers, e.g., for automobile bodies, comprise a thermoformable
AΒ
     plastic carrier, an adhesive on one side, and a multilayer system
     comprising a clear top layer, a pigmented base layer (contg. a
     thermoplastic binder and an aminoplast), and optionally, a tie-layer
     between the base layer and the carrier on the other side. The adhesive
     side is temporarily protected by paper or plastic film. Thus, a 7-mil
     polyester (PMB 10231) film was coated on one side with a 3-mil acrylic
     adhesive and coated on the other side with a 0.33-mil tie-layer prepd. by
     drying an aq. compn. contg. a polyester-polyoxyalkylene-
     polyurethane, an acrylic polymer, and a melamine resin 10 min at
     180.degree.F. The tie-layer side was coated with a 3.1-mil TiO2-pigmented
     polyester-polyoxyalkylene-polyurethane-melamine resin blend based layer
     (cured at 10 min at 180.degree.F) and overcoated with a 2.5-mil 2-package
     block polyester-polyurethane clear layer (cured 10 min at 180.degree.F).

    EP 1982-201648
                           19821222
    A coil coating compn. is described contg. 10-80% powd. polyamide
    with softening point 110-230.degree. and an av. particle size 0.5-200
     .mu., 20-90% polyol with no.-av. mol. wt. 800-20,000 and OH-functionality
    1.5-6, crosslinking agent in the mol. ratio 0.6-1.5:1 between
    polyol-reactive groups of this agent and polyol, and 40-60% org. solvent
    with b.p. 140-310.degree. for the polyol. Thus, a coating was prepd. by
    admixing 70% adipic acid-2,2-dimethyl-1,3-propanediol-ethylene
    glycol-isophthalic acid-1,1,1-trimethylolpropane copolymer
    28430-18-4] soln. in ethylene glycol acetate Et ether
     [111-15-9]-Solvesso 150 (1:2) mixt., 50; nylon 12 [24937-16-4] 40;
    hexamethoxymethylmelamine [3089-11-0] 9; solvent mixt. 20; pigment
    dispersion 81; leveling agent 2; and a crosslinking catalyst 0.1 part.
    The coating is applied onto an epoxy-primed steel substrate to thickness
    25-30 .mu. (in cured state) and dried at 300-400.degree. for 20-60 s,
    exhibited Gardner back impact resistance 160 in-lb, salt spray resistance
    600 h (ASTM B 117-64), wt. loss to abrasion 18 mg/1000 cycles, and good
    flexibility.

AB A multilayered metallic coating is formed by a 1 coat-1 bake process from a powder compn. contg. .gtoreq.2 incompatible resins differing in surface tension and multilayer formation parameter (Hd; H is creep height in cm of molten resin along inner wall of a vertical glass tube immersed in the molten resin, at a given time and

temp., and d is resin d. in g/cm3). The metallic pigment is covered with a resin whose surface tension is not the lowest among the resins used and the pigment is prevented from exposure to the resin surface. For example, 10:20:40:15:15 2-ethylhexyl acrylate-glycidyl methacrylate-iso-Bu methacrylate-Me methacrylate-styrene copolymer [69725-55-9] was milled with 17 phr dodecanedicargboxylic acid to av. particle size 45.mu. (max. particle size <74 .mu.) to give component A with Hd 0.85 g/cm2 and surface tension 80.6 dyne/cm. A 1:6:8:8:2.5 adipic acid-di-Me terephthalate-isophthalic acid-neopentyl glycol-trimethylolpropane copolymer (I) [65421-56-9] (Hd 0.55 g/cm2, surface tension 40 dyne/cm) was milled with 7 phr phthalocyanine blue and 80 phr .epsilon.-caprolactam-blocked isophorone diisocyanate (19% NCO) to give component B with Hd 0.48 g/cm2 and surface tension 45.8 dyne/cm. A 0.5% I soln. in acetone was mixed in 100:80 ratio with Al flake and spray-dried to give component C. A 40:60:5 A-B-C powder compn. was electrostatically coated on an epoxy-primed steel and baked at 185.degree. for 85 min to give a coating of 75 .mu.-thick silvery blue I layer and 45 .mu.-thick acrylic top layer. multilayer acrylic metallic paint; polyester multilayer metallic paint; epoxy multilayer metallic paint; powder coating metallic steel Coating materials (paint, metallic, multilayered, on steel, 1-step prepn. of) Coating materials (powder, metallic, multilayered, on steel, 1-step prepn. of) 37337-82-9 63266-53-5 **65421-56-9** 9004-36-8 25068-38-6 69841-05-0 69725-55-9 RL: USES (Uses) (coatings contg., metallic multilayer, on steel, 1-step prepn. of) 65421-56-9 RL: USES (Uses) (coatings contg., metallic multilayer, on steel, 1-step prepn. of) 65421-56-9 HCAPLUS 1,3-Benzenedicarboxylic acid, polymer with dimethyl 1,4benzenedicarboxylate, 2,2-dimethyl-1,3-propanediol, 2-ethyl-2-(hydroxymethyl)-1,3-propanediol and hexanedioic acid (9CI) (CA INDEX NAME) 1 CM 126-30-7 CMF C5 H12 O2 Me
